Bug: Inconsistent page width across westerly-club.net

ID	BUG-UI-001
Title	Inconsistent page width across pages on westerly-club.net
Type	Bug - UI/UX consistency
Severity	Minor
Priority	Low
Environment	www.westerly-club.net, Chrome (macOS)
Pages affected	/blogs (Blog Posts), Cockpit (profile page)
Date reported	19 Oct 2026

Description

The content width differs from page to page on westerly-club.net. The Blog Posts page and the Cockpit page use different container widths and margins, so the layout shifts when the user navigates between them.

Expected behaviour

All pages share the same container width, margins and grid, so the site feels consistent and the layout does not jump between pages.

Actual behaviour

The main content area is wide on the Blog Posts page (it spans nearly the full viewport) and narrower on the Cockpit page (it is centred in a fixed-width column with side margins).

Evidence

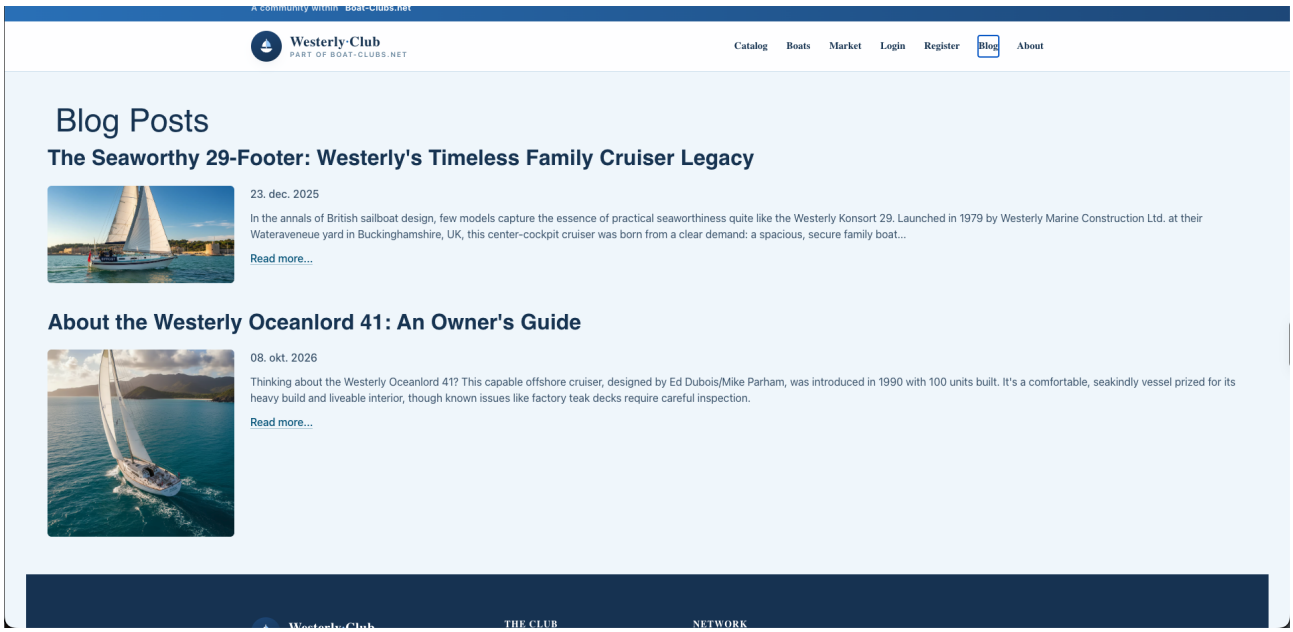

Figure 1: Blog Posts page (/blogs). Content spans nearly the full width of the viewport.

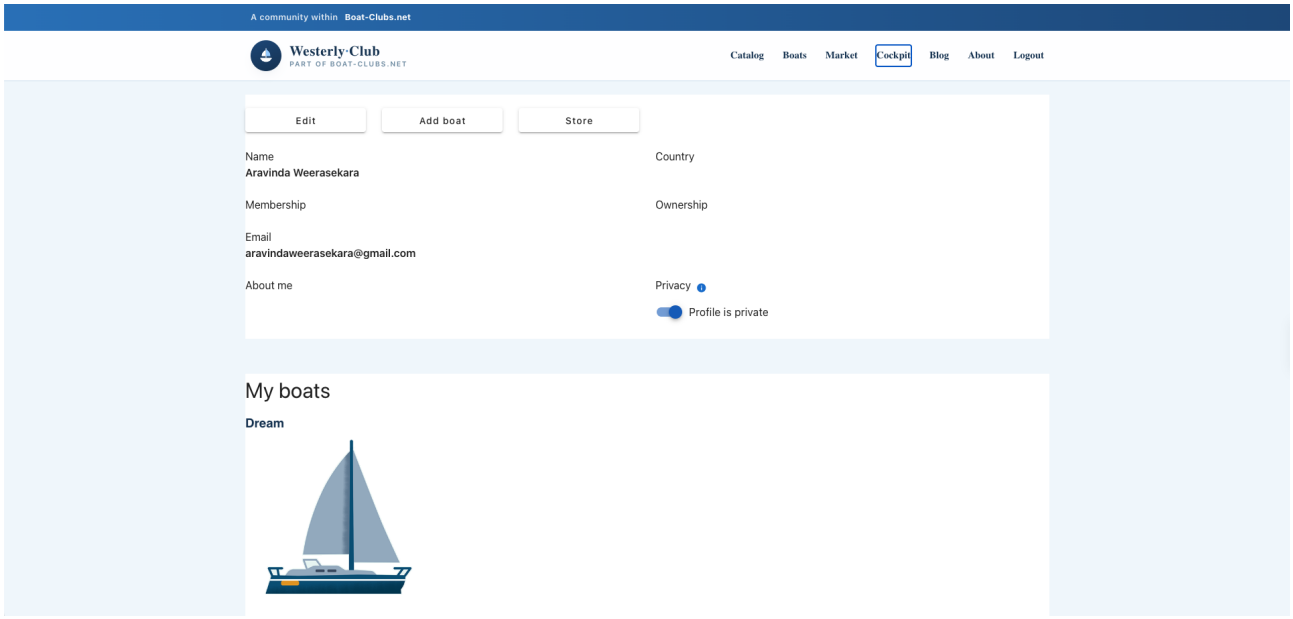

Figure 2: Cockpit page. Content is centred in a narrower column with wide side margins.

Steps to reproduce

1. Log in to www.westerly-club.net.
2. Open the Blog page (/blogs) and note the content width and left/right margins.
3. Open the Cockpit page from the top navigation.
4. Compare the content width and margins between the two pages.

Suggested fix

Define one shared layout container (max-width and horizontal padding) in the global stylesheet and apply it to all pages.

Note: IDs and page names are sample values for this ticket.
